ABSTRACT

Estriol is a major estrogen produced during pregnancy and is synthesized from the fetal precursor 16 α -hydroxy dehydroepiandrosterone sulfate (16 α -OH DHEAS) in the syncytiotrophoblast constituting the placental barrier. Organic anion transporter(s) at the basolateral membrane of the syncytiotrophoblast is pivotal in the uptake of 16 α -OH DHEAS from the fetus and would also influence the fetal concentration of some drugs. The purpose of this study is to clarify the transport mechanism of 16 α -OH DHEAS at the placental barrier. [³H]16 α -OH DHEAS was enzymatically converted from [³H]DHEAS using recombinant human CYP3A7. The uptake of [³H]16 α -OH DHEAS at the placental barrier was characterized using forskolin-induced differentiated JEG-3 human choriocarcinoma cells. The uptake of [³H]16 α -OH DHEAS via human organic anion transporter 4 (OAT4/SLC22A11) and organic anion transporter polypeptide 2B1 (OATP2B1/SLCO2B1) were examined using OAT4- or OATP2B1-transfected COS7 cells. The uptake of [³H]16 α -OH DHEAS in differentiated JEG-3 cells was significantly inhibited by 1 mM DHEAS, estrone sulfate (E₁S), and bromosulfophthalein (BSP), but not by 1 mM tetraethylammonium (TEA). Human OAT4-transfected COS7 cells exhibited [³H]16 α -OH DHEAS uptake activity with a K_m of 7.4 μ M, and moreover, this uptake was also inhibited by DHEAS, E₁S, and BSP, but not by TEA. On the other hand, the OATP2B1-mediated uptake of [³H]16 α -OH DHEAS was not exhibited. In conclusion, OAT4 appears to play a predominant role in the uptake of [³H]16 α -OH DHEAS from the fetal circulation and contribute to the estriol synthesis during pregnancy.
